

Culture Of Animal Cells A Manual Of Basic Technique

Animal cell cultures Depending on their origin, animal cells grow either as an adherent monolayer or in suspension. Adherent cells are anchorage-dependent and propagate as a monolayer attached to the cell culture vessel.

Animal cell culture basically involves the in vitro (in the laboratory) maintenance and propagation of animal cells in a suitable nutrient media. Thus, culturing is a process of growing cells artificially. Cell culture has become an indispensable technology in various branches of life sciences.

The most complete resource on the techniques, equipment, principles, and practices of animal cell culture. Since publication of the previous edition of this benchmark text, numerous types of equipment and materials have changed and new specialized techniques have been developed, particularly in the area of stem cell research and tissue engineering.

Serum is one of the very important components of animal cell culture which is the source of various amino acids, hormones, lipids, vitamins, poly- amines, and salts containing ions such as calcium, ferrous, ferric, potassium, etc. It also contains the growth factors which promotes cell proliferation, cell attachment and adhesion factors.

Animal Cell Culture: History, Types and Applications

Animal cell culture is the in vitro cultivation of animal cells under appropriate conditions. Animal cells especially require a wide range of ingredients for their in vitro growth. Here, glucose and glutamine serve as the main carbon, nitrogen as well as the energy source for the cells.

What is the Difference Between Animal Cell Culture and ...

Animal cells are eukaryotic cells that have both a membrane-bound nucleus and other membrane-bound organelles. These organelles carry out specific functions that are needed for the normal functioning of the cell. Plant and animal cells are similar in that they are both eukaryotic and have similar types of organelles.

Animal Cells and the Membrane-Bound Nucleus

The cell culture media is composed of a basal medium supplemented with appropriate growth factors and cytokines. Cells are grown and maintained at an appropriate temperature and gas mixture (typically, 37 °C, 5% CO₂ for mammalian cells) in a cell incubator. The culture conditions widely vary depending up on the cell type.
